Nursing Considerations for Enteral Tubes

MARY GALLEGOS RN
PEDIATRIC GASTROENTEROLOGY AND NUTRITION
UNIVERSITY OF NEW MEXICO HOSPITAL
Objectives

1. Discuss the indications and uses of a gastrostomy.
2. Describe the different types of gastrostomy tubes.
3. Identify complications of g tubes.
4. Describe Nursing assessment of pre and post-op care.
5. Discuss feeding types.
6. Identify teaching points for staff and parents.
7. Identify Nursing Considerations for feedings.
Disclosures

I have no disclosures at this time.
Why a Feeding Tube?

Placed when oral intake is not adequate to meet Nutritional Goals
Pediatric Nutrition Goals

- Provide nutrients for normal organ function
- Proper growth and development
- Protection from disease
- Part of a daily routine
Feeding Tube Indications

- Unable to swallow normally
- Inadequate oral nutrition
- Can be Permanent or Temporary
Common Diagnosis

- **Congenital Anomalies**
  - Esophageal fistula/Tracheoesophageal fistula
  - Cleft lip/palate
  - Intestinal Atresia’s
  - Gastroschisis

- **Genetic/Chronic Illness**
  - Down’s Syndrome
  - Failure to Thrive
  - GERD
  - Cystic fibrosis
  - Cancer
  - Congenital heart disease
  - Recurrent aspiration pneumonia
  - Oral aversion
  - Transplant
  - Cancer
Common Diagnosis

- Neurologic dysfunction - Temporary or Permanent
  - Closed Head Injury
  - Cerebral Palsy
  - Encephalopathy

- Feeding time >1 hour
Types of Tubes

- Nasogastric/Nasojejunal
- Gastrostomy
- Transgastric-jejunal
- Jejunal
Gastrostomy Definition

- “Gastro” meaning stomach
- “Ostomy” meaning opening
- Gastro+ostomy= simply an opening into the stomach
Placement Methods

- **Manual**
  - To ensure proper measurement tube should be measured from the tip of nose to the ear lobe to 1 inch below the xiphoid process. The tube should be marked at this place. Tube is then inserted through the nose into the stomach until the mark reaches the nostril. Tube is then secured in place. Proper placement should be checked prior to use per institutional protocol.
  - NJ placement should always be checked with x-ray.

- **Surgical**
  - Stomach is brought up to the abdominal wall and sutured in place. Then an opening is made and tube is placed.

- **Percutaneous Endoscopic Gastrostomy**
  - Endoscopy is performed and a guidewire is passed through the abdominal wall incision into the stomach. The guidewire is attached to the g tube with a mushroom device pulled down through the mouth into the stomach and through the abdominal wall incision. Must wait 1-3 months for stomach wall to adhere to the abdominal wall before changing.

- **Radiologically Guided**
  - Using Ultrasound the liver and spleen are identified and marked.
  - Under fluoroscopy a needle is passed through the abdominal wall into the stomach. A guidewire is placed and then dilators are passed over the guidewire to create the tract. When the tract is adequately sized the G tube is threaded over the guidewire and into the stomach. Must wait 1-3 months for healing before changing but can be converted to a G-J if needed.
History of Surgical Gastrostomy

- Watson 1844, Sellidot 1849, Egebert 1849
  - First attempts at surgical placement
  - None lived
- 1874 Syndey Jones London and Jacobi New York
  - Reported 27.46% mortality rate
- 1894 Stamm
  - Performed the surgical Stamm gastrostomy
- 1939 William Ladd (Father of Pediatric Surgery) Boston
  - First TEF repair with gastrostomy
- 1941 Leven
  - Popularized the surgical Stamm procedure
History of Percutaneous Endoscopic Gastrostomy (PEG)

- **1979 Gauderer and Ponsky**
  - First placement of PEG in a 10 week infant at the University of Cleveland Hospital

- **1980’s Gauderer, Ponsky, Izant**
  - Perfected the procedure

- Current standard for gastrostomy placement
- Over a million have been placed
- Annually over 100,000 are performed
Surgical Gastrostomy or PEG

- Anatomy
- Previous abdominal surgeries
- Significant reflux
- Size of the child
- Complications
- Cost
Parental vs. Enteral Feedings

- **Parental**
  - Cholestatic liver disease
  - Metabolic disturbances
  - Line sepsis
  - Bacterial translocation

- **Enteral**
  - Prevents gut atrophy
  - Encourages villi growth
  - Increases bowel motility
  - Prevents bacterial overgrowth
Feeding Tubes Components

- Three components present
  - Internal portion
    - Mushroom
    - Balloon
    - Dome
    - Cross
    - Collapsible ring
  - External portion
  - Feeding connector
- Tubes can differ at all three places
- Catheter Tube/Low profile button
Mushroom Devices

- **Buttons**
  - American Medical Technology (AMT)
  - Wilson Cook Device
- **Catheter**
  - Malecot
Balloon Devices

- **Button**
  - AMT balloon button
  - Mickey balloon button

- **Catheter tubes**
  - Mic Tube
  - Foley Tubes
Mickey Button
Dome Devices

- **Button**
  - Bard Button
  - Genie button

- **Catheters**
  - Bard-Ponsky
  - Genie Peg
Genie (Peg) Tube
Cross Devices

- Nutriport
- Entristar
Feeding Connectors

- Straight Adapter
- Right Angle Adapter
- Genie Adapter
- Corpak
Current Use in Our Practice

- Mickey Buttons
- AMT mini one
- Genie (Peg tube)
- Bard buttons
- Nutri-port balloon device
When is the right time?

When nutritional support will be needed beyond 4-12 weeks dependent on author
Decisions

- **Family acceptance**
  - Innate need to feed children
  - Another loss of normalcy for this child

- **Nurse’s role**
  - Support
  - Help family formulate their questions
  - Answer questions
  - Emphasize the importance of family’s role in recovery
  - Allow family time to grieve
Pre Op Care

- Offer anesthesia consult especially for children with complicated history
- Vital signs
- Signed consent
- Maintain NPO status
- History
- Allergies
- Medications
Post Op Care Assessment

- Vital signs including pain
- Normal Surgical assessment
  - Head to Toe assessment
  - Hydration status
  - Accurate Intake and Output
- Pain Management
Post Op Care and Assessment

- Abdominal assessment
  - Look, Listen, Feel
  - Check the G tube site
  - Bowel sounds
  - Palpate abdomen
Care of The Site

- Assess the site daily for signs and symptoms of infection redness, swelling, pain, drainage, strong odor.

- Small amounts of serosanguinuous drainage and redness is normal.
Care of the Site

- Site should be cleaned twice daily with saline for the first week and then soap and water
- Tube should be rotated with each cleaning
- Split non-adherent dressing should be changed with cleanings
- Tub baths/swimming allowed after 1 week
- Only use ointment if there is swelling
Care of the Tube

- Protect the tube and site
- Prevent excessive movement of the tube
- Prevent the tube from being pulled out or becoming tangled
- Stabilize the tube with bar/disc
  - ¼ inch away from skin
  - Can tape down
Complications

- Hemorrhage
- Bowel Perforation
- Liver laceration
- Peritonitis
- Wound separation
- Infection

- Tube migration
- Aspiration
- Necrotizing Fasciitis
- Bowel obstruction
- Death
Complications

- Skin infections
- Tube migration/Bumper Buried
- Leakage
- Ulcerations
- GERD
- Bacterial Overgrowth
- Dumping Syndrome
- Granuloma
- Tube clogged
Granulomas

- Prevention
- Stabilizing the tube
- Use soap and water to clean frequently
- Turn frequently
- Antibiotic ointment
- No Gauze
When To Start Feeding

- 1 – 3 hours post surgery check for bowel sounds prior to starting
- Pedialyte starting with $\frac{1}{2}$ maintenance continuous feedings
- Advance slowly to full strength feeds within 72 hours
Feedings

- Bolus
- Continuous
- Combination
- Pump
- Gravity

Prescriptions should be obtained
  - Formula
  - Total amount/day
  - Bolus/continuous/combination/pump/gravity
  - Oral feedings
Feedings

- **Bolus Vs. Continuous**
  - Type of tube
  - Placement of the tube
  - Diagnosis of the patient

- **Bolus feedings should never be given through a Jejunal port**
Feeding equipment

Gather all supplies that are necessary

- Bolus - Large 60ml cath tip syringe
- Pump - Pump and feeding bags
- Pole for gravity or pump feedings
- Feeding extensions/adapters
- Formula
- Paper drape/towel
- Gloves
Feeding Procedure

- Mix formula and pour total amount to be given into a graduate/if using a pump use a feeding bag.
- Put on your gloves.
- Drape the towel over the patient’s abdomen next to the gastrostomy.
- Clamp the tube prior to pouring it in the bag if giving pump feeding. Prime the tubing (sometimes done by the pump itself).
- If using a pump, hang bag on the pole and thread the tubing through the pump.
- Patient should be upright at least 30 degrees.
Feeding Procedure

- Prime the feeding adapter with formula or water
- Close the clamp
- Attach the Feeding extension/adapter to button/g-tube
- Open the clamp
- Tube should be flushed with warm water prior to beginning feedings (Usually 30 to 60ml) using a syringe
Feeding Procedure

- Connect the syringe to the extension/adapter for bolus or the feeding bag tubing for continuous/gravity feedings.
- Open clamp and allow to flow either turning on the pump or pouring formula into the syringe.
- If using gravity formula should not go in faster than over hour dependant on amount to be infused.
- When formula complete then flush with warm water to clear the tubing.
- Close the clamp and disconnect the tubing.
- Close the gastrostomy.
Cleaning the tubing

- Flushing should be done before and after medication administration, and feedings. This will keep the tube from becoming clogged.
- Wash out rinse or wash out your tubing with each feeding.
- Some doctors recommend keeping the tubing in the refrigerator to prevent bacterial growth.
- If tubing becomes cloudy can use a 3:1 water/vinegar solution to clean tubing.
- Tubing should be changed every week.
Medication Administration

- If the gastrostomy has a side port for medication administration, this port should be used.
- Check with pharmacist on which medications can be crushed to put down the tube (Be careful with capsules - the beads can get stuck in the tube).
- Check with pharmacist or physician on how much water to mix with medications.
- Be sure to flush before and after each medication.
- Check with pharmacist before mixing medications together.
Other Nursing Considerations

- **Mouth care is extremely important in patients not taking in oral nutrition.**
  - Brush teeth twice daily as you normally would
  - Keep mouth moist with swabs
  - Can use mouthwash to swish and spit
  - Use lip balm to avoid chapped lips

- **Nose may become sore with a naso tube.**
  - Wash nostrils when they become crusty and at least once daily
  - Clean and re-tape daily using adhesive remover
  - Use a lip balm around the nostril edges to moisturize
Problems Associated with Tube Feedings

- Constipation
- Diarrhea
- Nausea
- Dehydration
- Fluid overload
- Aspiration
- Clogged tube
- Leaking at the site
- Site is red/itchy with raised rash.
- Site is irritated/dRAINING
- Granuloma
- Tube is accidentally removed
- Bleeding/Hematochezia
- Potential developmental delay
## Constipation

<table>
<thead>
<tr>
<th>Causes</th>
<th>Treatments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not enough water is being given with feedings</td>
<td>Check with dietician/physician to make sure you are getting enough water and fiber in their diet</td>
</tr>
<tr>
<td>Not enough or no fiber</td>
<td>Try to increase physical activity</td>
</tr>
<tr>
<td>Lack of physical activity</td>
<td>Review medication list with physician to see if any medication changes may help</td>
</tr>
<tr>
<td>Medications</td>
<td></td>
</tr>
</tbody>
</table>
# Diarrhea

## Causes
- Medications
- Formula being fed too fast
- Tube migration into the small intestine/dumping syndrome
- Formula is too cold
- Formula may be spoiled/contaminated by bacteria
- Not enough or no fiber in diet
- Emotional disturbances
- Formula intolerance

## Treatments
- Review medication list with the physician
- Check with the physician to see if rate can be slowed
- Check that the tube has not migrated away from the stomach wall/stabilize the tube
- Remove formula from refrigerator 30min before giving. Warm to room temperature
- Check with physician/dietician to see if formula should be changed
- Relax during feedings
# Nausea

## Causes

- Tube mushroom/balloon has migrated causing a blockage at the stomach
- Feeding is too fast
- Feeding volume too much
- Positioning
- Delayed gastric emptying
- Gastritis
- Constipation
- Exercising right after a feeding
- Formula intolerance

## Treatments

- Ensure proper positioning of the tube
- Decrease the feeding rate
- Decrease the volume by increasing the frequency to keep the total volume the same for the day
- Feed over a longer period—may need to go to continuous feedings
- Vent the tube frequently
- Monitor stool output for frequency and consistency
- Clean equipment well
# Dehydration

## Causes

- Formula too concentrated
- Frequent diarrhea
- Prolonged fever
- Not enough water
- Perspiring heavily
- Wound is draining large amounts of fluid

## Treatments

- Check with your physician regarding formula type and water intake
- Call physician for direction with a child with fever/diarrhea
# Fluid Overload

<table>
<thead>
<tr>
<th>Causes</th>
<th>Treatments</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Too much water before or after the feedings</td>
<td>- Check with your physician/dietician about the amount of water you should be taking each day</td>
</tr>
<tr>
<td>- Feeding rate is too high</td>
<td>- Do not dilute formula with more than prescribed amount of water</td>
</tr>
<tr>
<td>- Fluid volume is too high due to diluted formula</td>
<td></td>
</tr>
</tbody>
</table>
# Aspiration

## Causes
- Tube migration
- Lying flat during feeding
- Formula back up
- Constipation

## Treatments
- Check the position of the tube
- Be sure to sit up at least 30 degrees with every feeding and 30-60 minutes after
- Monitor bowel movements for frequency and consistency
Clogged Tube

**Causes**

- Clamped tube
- Kink in the tubing or the tube
- Dried formula/medication blocking the tube

**Treatments**

- Check the clamps to make sure all are open
- Use the syringe plunger to give to give a brief pulsing type method
- Instill a small amount of carbonated drink or seltzer water. Clamp the tube for 30 minutes and then flush using the pulsing method
- Flush with water followed by air after each feeding
## Leaking at the Site

<table>
<thead>
<tr>
<th>Causes</th>
<th>Treatments</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Balloon/mushroom has moved away from the stomach wall</td>
<td>- Gently pull back on the tube to ensure that the balloon/mushroom is up against the stomach wall</td>
</tr>
<tr>
<td>- Balloon has lost water</td>
<td>- Check the amount of water in balloon at least weekly. It should be 5 ml for most of the balloons</td>
</tr>
<tr>
<td>- Stoma has become larger (usually from excessive movement of the tube)</td>
<td>- Stabilize the tube with tape, barrier</td>
</tr>
<tr>
<td>- Increased pressure in the stomach from air, delayed gastric emptying, coughing, constipation</td>
<td>- Vent the tube before and after feedings</td>
</tr>
<tr>
<td>- Tube diameter is too small</td>
<td>- Monitor stools</td>
</tr>
<tr>
<td>- Perpendicular positioning of the tube is not maintained</td>
<td>- Maintain the tube in the upright position using tape to secure if necessary</td>
</tr>
<tr>
<td>- Valve is defective</td>
<td>- Change the tube</td>
</tr>
<tr>
<td>Causes</td>
<td>Treatments</td>

<tr>
<td>Candida skin infection</td>
<td>Keep skin clean and dry</td>
</tr>
<tr>
<td></td>
<td>Apply antifungal cream or powder three times daily until clear</td>
</tr>
</tbody>
</table>
## Site with drainage and irritation

<table>
<thead>
<tr>
<th>Causes</th>
<th>Treatments</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Leakage of gastric juices from the stoma site/dampness around the tube</td>
<td>• Keep clean and dry - apply a non adherent dressing around the site</td>
</tr>
<tr>
<td>• Infection of the site</td>
<td>• Can use stoma adhesive powder to the site</td>
</tr>
<tr>
<td>• Stitches/stay sutures irritated</td>
<td>• Zinc oxide cream applied to area around the site</td>
</tr>
<tr>
<td>• Stabilization bar too tight or too loose</td>
<td>• Topical antibiotic ointment</td>
</tr>
<tr>
<td>• All g tube sites leak</td>
<td>• Antibiotic therapy if needed (very rare)</td>
</tr>
<tr>
<td></td>
<td>• Stitches can be removed according to physician recommendation</td>
</tr>
<tr>
<td></td>
<td>• Proper adjustment of the stabilization bar - ¼ inch space between the bar and the skin</td>
</tr>
</tbody>
</table>
Granuloma

**Causes**

- Normal response of the body
- Excessive movement of the tube
- May be associate with a small amount of bleeding or a thick yellow-green drainage may occur

**Treatments**

- Cauterization with silver nitrate to the area. Excessive use of the silver nitrate can be irritating to the healthy skin. Can develop into scar tissue and require surgical removal
- Stabilize the tube
<table>

## Potential Developmental Delay

### Causes
- Enteral feedings and tubes may affect development of feeding skills and normal development including speech

### Treatments
- Age appropriate activities should be encouraged
- Use a low profile device as soon as possible so it does not get in the way of crawling/lying on belly
- Feeding schedule should be set up to encourage an oral activity be associated with feelings of hunger
- Oral aversion - consult occupational/speech therapy
- Encourage use of Early Intervention
# Teaching for Parents

- Know what type and size of tube patient has
- Understand feeding schedules/oral feedings
- Understand how to use equipment
- What and Who to call for problems
- Know name and phone numbers of homecare company, pharmacy, and physicians
- How to mix formula and measure formula
- Signs and symptoms of dehydration
- Teach oral care and dental care
- Skin care
- Tube care
- Teach parents how to include child in family dinner time
- Emotional support
